

HR Analytics – Employee Attrition Analysis

Business Problem:

The Human Resources department is experiencing employee attrition across different departments, salary levels, experience ranges, and job roles. High employee turnover increases recruitment costs, reduces productivity, and impacts business performance. Management requires an interactive Power BI dashboard to identify the key drivers of attrition and support data-driven retention strategies.

The objective is to analyze employee demographics, job satisfaction, salary, experience, and departmental distribution to determine which employee groups are most likely to leave the organization.

Business Objectives

1. Measure the overall employee attrition rate.
2. Identify departments with the highest employee turnover.
3. Analyze attrition by salary slab.
4. Determine which job roles have the highest attrition.
5. Understand the relationship between job satisfaction and attrition.
6. Analyze attrition based on employee experience.
7. Compare attrition by gender.
8. Identify age groups with the highest number of employees.
9. Monitor department-wise employee distribution.

Provide HR with actionable insights to improve employee retention.
